## PIRAZINO(AZA)INDOLE DERIVATIVES

The present invention relates to pyrazinoindole derivatives, to pharmaceutical compositions containing them and to their medicinal use. The active compounds of the present invention are useful in treating obesity and other disorders.

It has been recognised that obesity is a disease process influenced by environmental factors in which the traditional weight loss methods of dieting and exercise need to be supplemented by therapeutic products (S. Parker, "Obesity: Trends and Treatments", *Scrip Reports*, PJB Publications Ltd, 1996).

Whether someone is classified as overweight or obese is generally determined on the basis of their body mass index (BMI) which is calculated by dividing body weight (kg) by height squared ( $m^2$ ). Thus, the units of BMI are  $kg/m^2$  and it is possible to calculate the BMI range associated with minimum mortality in each decade of life. Overweight is defined as a BMI in the range  $25-30kg/m^2$ , and obesity as a BMI greater than  $30 kg/m^2$ . There are problems with this definition in that it does not take into account the proportion of body mass that is muscle in relation to fat (adipose tissue). To account for this, obesity can also be defined on the basis of body fat content: greater than 25% and 30% in males and females, respectively.

As the BMI increases there is an increased risk of death from a variety of causes that is independent of other risk factors. The most common diseases with obesity are cardiovascular disease (particularly hypertension), diabetes (obesity aggravates the development of diabetes), gall bladder disease (particularly cancer) and diseases of reproduction. Research has shown that even a modest reduction in body weight can correspond to a significant reduction in the risk of developing coronary heart disease.

Compounds marketed as anti-obesity agents include Orlistat (Reductil ®) and Sibutramine. Orlistat (a lipase inhibitor) inhibits fat absorption directly and tends to produce a high incidence of unpleasant (though relatively harmless) side-effects such as diarrhoea. Sibutramine (a mixed 5-HT/noradrenaline reuptake inhibitor) can increase blood pressure and heart rate in some patients. The serotonin releaser/reuptake

inhibitors fenfluramine (Pondimin®) and dexfenfluramine (Redux™) have been reported to decrease food intake and body weight over a prolonged period (greater than 6 months). However, both products were withdrawn after reports of preliminary evidence of heart valve abnormalities associated with their use. There is therefore a  
5 need for the development of a safer anti-obesity agent.

The non-selective 5-HT<sub>2C</sub> receptor agonists/partial agonists m-chlorophenylpiperazine (mCPP) and trifluoromethylphenylpiperazine (TFMPP) have been shown to reduce food intake in rats (G.A. Kennett and G. Curzon,  
10 *Psychopharmacol.*, 1988, 98, 93-100; G.A. Kennett, C.T. Dourish and G. Curzon, *Eur. J. Pharmacol.*, 1987, 141, 429-453) and to accelerate the appearance of the behavioural satiety sequence (S.J. Kitchener and C.T. Dourish, *Psychopharmacol.*, 1994, 113, 369-377). Recent findings from studies with mCPP in normal human volunteers and obese subjects have also shown decreases in food intake. Thus, a single injection of mCPP  
15 decreased food intake in female volunteers (A.E.S. Walsh *et al.*, *Psychopharmacol.*, 1994, 116, 120-122) and decreased the appetite and body weight of obese male and female subjects during subchronic treatment for a 14 day period (P.A. Sargeant *et al.*, *Psychopharmacol.*, 1997, 113, 309-312). The anorectic action of mCPP is absent in 5-HT<sub>2C</sub> receptor knockout mutant mice (L.H. Tecott *et al.*, *Nature*, 1995, 374, 542-546)  
20 and is antagonised by the 5-HT<sub>2C</sub> receptor antagonist SB-242084 in rats (G.A. Kennett *et al.*, *Neuropharmacol.*, 1997, 36, 609-620). It seems therefore that mCPP decreases food intake via an agonist action at the 5-HT<sub>2C</sub> receptor. However, although both mCPP and TFMPP exhibit high affinity for the 5-HT<sub>2C</sub> receptor they are both non-selective, having appreciable activity at other 5-HT receptors (G.A. Kennett, *Curr. Opin. Invest.*  
25 *Drugs*, 1993, 2, 317-362).

The preparation of pyrazino[1,2-*a*]indoles as serotonergic agents, useful as antidepressants and anxiolytics, is disclosed in PCT application WO 9612721. The compounds of this invention are reported to possess high affinity for the serotonergic 5-  
30 HT<sub>1A</sub> receptor. Substituted pyrazino[1,2-*a*]indoles are used as intermediates in the preparation of heterocyclyl O-substituted alcoholamines as fibrinogen receptor antagonist products as disclosed in PCT application WO 9800401. Pyrazino[1,2-*a*]indole derivatives are also reported in the preparation of 3-

piperazinomethylpyrrolo[2,3-*b*]pyridines as dopamine D4 receptor antagonists as disclosed in US 5576319 and WO 9420497. 1,2,3,4,10,10a-Hexahydropyrazino[1,2-*a*]indole and 3-ethyl-1,2,3,4,10,10a-hexahydropyrazino[1,2-*a*]indole are disclosed in *Med. Chem. Res.*, 1993, 3, 240-248 and their 5-HT<sub>1A</sub> and 5-HT<sub>2</sub> binding affinity  
 5 reported. The 5-HT<sub>1A</sub> and 5-HT<sub>2</sub> binding affinity for 1,2,3,4,10,10a-hexahydropyrazino[1,2-*a*]indole is reported to be the same as that observed for 1-phenylpiperazine and demonstrates an approximate ten fold selectivity for 5-HT<sub>1A</sub> receptors.

10 It is an object of this invention to provide selective, directly acting 5-HT<sub>2</sub> receptor ligands for use in therapy and particularly for use as anti-obesity agents. It is a further object of this invention to provide directly acting ligands selective for 5-HT<sub>2B</sub> and/or 5-HT<sub>2C</sub> receptors, for use in therapy and particularly for use as anti-obesity agents. It is a further object of this invention to provide selective, directly acting 5-  
 15 HT<sub>2C</sub> receptor ligands, preferably 5-HT<sub>2C</sub> receptor agonists, for use in therapy and particularly for use as anti-obesity agents.

30 Compounds of the invention may be prepared by conventional methods as illustrated in the Reaction Schemes.  $R_1$  to  $R_7$  and  $X_1$  to  $X_4$  are as previously defined.

## Reaction Scheme 1

Compounds of formula (I), with  $\text{X}_1$  to  $\text{X}_4$  as previously defined and  $\text{R}_1 = \text{R}_2 = \text{R}_3 = \text{H}$  are conveniently prepared as indicated in Reaction Scheme 1. The methyl 1-(cyanomethyl)-indole-2-carboxylate (III) can be obtained through reaction of the sodium salt of indole carboxylate (II), prepared through treatment of (II) with a base such as sodium hydride in a solvent such as dimethylformamide with a cyanomethylation agent such as chloroacetonitrile. Reduction of (III) to the tetrahydropyrazino[1,2-a]indole (IV) may be achieved with a reducing agent such as lithium aluminium hydride in a suitable solvent such as ether. A compound of formula (I) can be obtained by the subsequent reduction of the tetrahydropyrazino[1,2-a]indole (IV) with a reducing agent such as sodium cyanoborohydride in a suitable solvent such as acetic acid.

Compounds of formula (I), with  $\text{X}_1$  to  $\text{X}_4$  as previously defined and  $\text{R}_1 = \text{R}_3 = \text{H}$  and  $\text{R}_2 = \text{loweralkyl}$  are conveniently prepared by standard methods such as reductive alkylation with an appropriate aldehyde or ketone in the presence of a reducing agent such as sodium triacetoxyborohydride, formic acid or sodium cyanoborohydride.

## Reaction Scheme 2

Compounds of formula (I), with  $X_1$  to  $X_4$  as previously defined and  $R_1 = R_2 = H$  and  $R_3 = Methyl$  are conveniently prepared as indicated in Reaction Scheme 2. The dihydroindole carboxylate (V) can be obtained from the indole carboxylate (II) through reduction with a reducing agent such as magnesium in methanol. The dihydro indole alanine ester derivative (VI) can be prepared by treatment of the dihydroindole (V) with a suitably protected alanine derivative such as BOC-alanine in the presence of a coupling agent such as dicyclohexylcarbodiimide (DCC) in a suitable solvent such as dichloromethane. The pyrazino[1,2-a]indole-1,4-dione derivative (VII) can subsequently be prepared by sequential treatment of (VI) with an acid such as hydrogen chloride in methanol followed by a base such as ammonia in methanol. Compounds of formula (I) can then be obtained by reduction of (VII) with a suitable reducing agent such as lithium aluminium hydride in a solvent such as tetrahydrofuran.

Compounds of formula (I), with  $X_1$  to  $X_4$  as previously defined and  $R_1 = R_3 = H$  and  $R_2 = lower\ alkyl$  are conveniently prepared by standard methods such as reductive alkylation with an appropriate aldehyde or ketone in the presence of a reducing agent such as sodium triacetoxyborohydride, formic acid or sodium cyanoborohydride.

## Reaction Scheme 3

Compounds of formula (I), with  $X_1$  to  $X_4$  as previously defined are conveniently prepared according to Reaction Scheme 3 (above). The indole-ethylamine (IX) can be obtained by alkylation of the indole (VIII) using, for example, chloroethylamine and a base such as sodium hydroxide in a solvent such as acetonitrile or dichloromethane in the presence of a phase-transfer catalyst. The tetrahydropyrazino[1,2-a]indole (X) can be prepared in a two-step procedure from the indole-ethylamine (IX) by treatment with an aldehyde such as formaldehyde followed by exposure to an acid such as trifluoroacetic acid. A compound of formula (I) can then be obtained by reduction of the tetrahydropyrazino[1,2-a]indole (X) using a reducing agent such as sodium cyanoborohydride in a solvent such as acetic acid.

Compounds of formula (I) where  $R_2$  = loweralkyl may conveniently be prepared from compounds of formula (I) where  $R_2$  = H using standard methods such as reductive alkylation with an aldehyde or ketone in the presence of a reducing agent such as sodium triacetoxyborohydride, formic acid or sodium cyanoborohydride.

Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations 15 may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (e.g. sorbitol syrup, methyl cellulose or hydrogenated edible fats); emulsifying agents (e.g. lecithin or acacia); non-aqueous vehicles (e.g. almond oil, oily esters or ethyl alcohol); and preservatives (e.g. methyl or propyl p-hydroxybenzoates or sorbic acid).

20

For buccal administration the composition may take the form of tablets or lozenges formulated in conventional manner.

25           The active compounds of the invention may be formulated for parenteral administration by injection, including using conventional catheterization techniques or infusion. Formulations for injection may be presented in unit dosage form e.g. in ampoules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulating agents such as suspending, stabilizing and/or dispersing agents. 30

Alternatively, the active ingredient may be in powder form for reconstitution with a suitable vehicle, e.g. sterile pyrogen-free water, before use.

The active compounds of the invention may also be formulated in rectal compositions such as suppositories or retention enemas, *e.g.*, containing conventional suppository bases such as cocoa butter or other glycerides.

### 30 Assay Procedures

#### 1. Binding to serotonin receptors

The binding of compounds of formula (I) to serotonin receptors was determined *in vitro* by standard methods. The preparations were investigated in accordance with the assays given hereinafter.

5           Method (a): For the binding to the 5-HT<sub>2c</sub> receptor the 5-HT<sub>2c</sub> receptors were radiolabelled with [<sup>3</sup>H]-5-HT. The affinity of the compounds for 5-HT<sub>2c</sub> receptors in a CHO cell line was determined according to the procedure of D. Hoyer, G. Engel and H.O. Kalkman, *European J. Pharmacol.*, 1985, 118, 13-23.

10          Method (b): For the binding to the 5-HT<sub>2B</sub> receptor the 5-HT<sub>2B</sub> receptors were radiolabelled with [<sup>3</sup>H]-5-HT. The affinity of the compounds for human 5-HT<sub>2B</sub> receptors in a CHO cell line was determined according to the procedure of K. Schmuck, C. Ullmer, P. Engels and H. Lubbert, *FEBS Lett.*, 1994, 342, 85-90.

15          Method (c): For the binding to the 5-HT<sub>2A</sub> receptor the 5-HT<sub>2A</sub> receptors were radiolabelled with [<sup>125</sup>I]-DOI. The affinity of the compounds for 5-HT<sub>2A</sub> receptors in a CHO cell line was determined according to the procedure of D. J. McKenna and S. J. Peroutka, *J. Neurosci.*, 1989, 9/10, 3482-90.

## 25   2. Functional activity

The functional activity of compounds of formula (I) was assayed using a Fluorimetric Imaging Plate reader (FLIPR):

CHO cells expressing either the h5-HT<sub>2C</sub> or h5-HT<sub>2A</sub> receptors were counted and plated into standard 96 well microtitre plates before the day of testing to give a confluent  
30   monolayer. The following day the cells were dye loaded with the calcium sensitive dye

Fluo 3-AM by incubation with serum free culture maintenance media containing pluronic acid and Fluo 3-AM dissolved in DMSO at 37 °C in a CO<sub>2</sub> incubator at 95% humidity for approximately 90 minutes. Unincorporated dye was removed by washing with Hanks balanced salt solution containing 20mM HEPES and 2.5mM probenecid  
 5 (the assay buffer) using an automated cell washer to leave a total volume of 100µl/well.

The drug (dissolved in 50µl of assay buffer) was added at a rate of 70µl/sec to each well of the FLIPR 96 well plate during fluorescence measurements. The measurements are taken at 1 sec intervals and the maximum fluorescent signal was measured (approx 10-  
 10 15 secs after drug addition) and compared with the response produced by 10µM 5-HT (defined as 100%) to which it is expressed as a percentage response (relative efficacy). Dose response curves were constructed using Graphpad Prism (Graph Software Inc.).

The thus determined activity of the compounds is shown in Table 2.

### 3. Efficacy

The efficacy of 5-HT<sub>2c</sub> agonists was assessed for ability to induce a specific syndrome.

5 The 5-HT<sub>2c</sub> syndrome is a rapid screening method to assess the *in vivo* efficacy of 5-HT<sub>2c</sub> agonists through their ability to induce three specific behaviours in rats. The animals are dosed with either a positive control (mCPP), test compound or vehicle, either s.c. or p.o.. The animals are observed on an open bench, typically 30, 60 and 180 minutes and the degree of syndrome is assessed over a two minute period on a scale of  
10 0-3 depending on the presence and severity of splayed limbs, hunched posture and retro-pulsion, the three specific behaviours which constitute the syndrome. Data is analysed using Kruskal-Wallis Analysis of Variance followed with appropriate post-hoc tests. All statistical analysis are conducted using Excel version 7.0 (Microsoft Corp.) and Statistica version 5.0 (Stasoft, Inc.).

15

The thus determined activity of Example 1 indicated that after a dose of 1mg/kg s.c. the compound maintains a significant pharmacological efficacy for at least 180 minutes.

### 4. Regulation of feeding behaviour

20 The *in vivo* activity of compounds of formula (I) was assayed for ability to regulate feeding behaviour by assaying food consumption in food deprived animals as follows.

Test compounds are assessed following acute administration. Each study utilises a between-subjects design (typically n=8) and compares the effects of doses of the test  
25 agent to those of vehicle and a positive control.

The anorectic drug d-fenfluramine normally serves as a positive control. The route of drug administration, drug volume and injection-test-interval are dependent upon the compounds used. A palatable wet mash, made by adding powdered lab chow and water  
30 in a ratio of 1:2 and mixing to a smooth consistency, is presented in 120 mL glass jars for 60 minutes each day. Intake is measured by weighing before and after each session. Care is taken to collect all spillage. Animals are allowed to habituate to the wet mash meal for 10 days. After drug administration, animals are allowed to consume the wet

mash. Food consumption is assayed at pre-determined time points (typically 1, 2 and 4 hours after administration). Food intake data are subjected to one-way analysis of variance (ANOVA) with drug as a between-subjects factor. A significant main effect is followed up by the performance of Dunnett's test in order to assess which treatment mean(s) are significantly different from the control mean. All statistical analyses were performed using Statistica Software, Version 5.0 (Statsoft Inc.) and Microsoft Excel 7.0 (Microsoft Corp.).

The thus determined activity of Example 1 indicated that the compound maintains significant hypophagia 3 hours after a dose of 1 mg/kg s.c.

20 Potassium *tert*-butoxide (11.22 g, 0.1 mol) was added portionwise to stirred ethanol (25 mL) under Ar at ambient temperature. When the resultant viscous solution had cooled sufficiently, ether (300 mL) was added followed by diethyl oxalate (13.6 mL, 0.1 mol). After 10 min, 2-chloro-6-nitrotoluene (17.16 g, 0.1 mol) was added and the yellow solution became dark red. The reaction mixture was transferred to a conical flask and

25 was stoppered and left standing at ambient temperature for 4 h, and was then transferred to the fridge for 65 h. The solid was collected by filtration, washed with ether until the filtrate ran colourless, and was sucked dry for 15 min. The isolated product (22.61 g, 73%) was used without further purification.

To a solution of the above solid (11.2 g, 36.2 mmol) in acetic acid (250 mL) was added

30 iron powder (7.08 g, 127 mmol) and the mixture was heated to 90 °C (external). As the

external temperature reached ~ 90 °C an exotherm became apparent, with the internal temperature reaching 100 °C. The mixture became a light brown suspension, and after 15 min the exotherm had subsided. After a further 3 h at 90 °C the reaction was allowed to cool to 45 °C and was then poured into ice-water (500 mL). The mixture was extracted with ether (3 x 400 mL) and the combined extracts were washed with saturated aqueous sodium bicarbonate solution (repeated until effervescence ceased), water (400 mL), and 1N HCl (2 x 300 mL). The organic extracts were dried (magnesium sulfate) and the solvent removed *in vacuo* to afford the crude product as a yellow-orange oil (5.38 g).
